

Evermount business plan

Financial technology and market infrastructure. Working draft aligned with the public site at www.evermount.co. No AUM, revenue, customer, or license figures are invented here.

Positioning decision. The public company is a technology and infrastructure vendor, not a marketed investment fund. The logged-in product still contains wallets, deposits, and investment flows. This plan treats that split as a product-architecture issue to resolve, not as something to advertise.

1. Company

Evermount builds programmable infrastructure for market data, quantitative research, intelligence, risk, and execution. Founded in 2023. Public brand is globally oriented. Headquarters contact on the site includes info@evermount.co. The company must not claim broker, adviser, exchange, or custody status on the public site or in sales materials unless counsel confirms it.

2. Problem

Institutions, trading firms, and fintechs still assemble market data, research tooling, risk controls, and execution connectivity from fragmented vendors. Building that stack in-house is slow and expensive. The public site sells a unified infrastructure story. The honest current state is earlier: research and engineering capability, a Next.js commercial site, an existing account/wallet application, and a separate internal gold options / GEX research engine that is not a public product.

3. Solution (two tracks)

Track A — Infrastructure (public). Quoted access to platform capabilities as they become real: data, research tooling, analytics, risk, and later execution connectivity. Primary CTA is Request Access. Pricing tiers are Developer, Professional, Institutional, and Enterprise — terms are quoted, not listed as fund fees.

Track B — Account application (private). /login and /dashboard still implement investor-style wallets, deposits, withdrawals, investment options, KYC, statements, and admin. Keep it running for existing flows. Do not lead the public site with it. Decide later whether Track B becomes a gated account product, a sandbox, or is retired.

4. Who we sell to

Do not list every institution type equally. Near-term ICPs:

- Trading firms and fintechs that need research, data, and risk APIs.
- Developers integrating market data and analytics (gated keys).
- Later: brokers and asset managers once connectivity and controls are real.

Exchanges, banks, and market makers remain a longer-term audience. Naming them all on the homepage maps the TAM for competitors without converting buyers.

5. Offer and pricing

Tier	Intent	Public claim
Developer	Sandbox, limited API, historical data, docs — when live	Potential capabilities; quoted
Professional	Real-time data, analytics, risk, execution where enabled	Quoted; not generally available

Tier	Intent	Public claim
Institutional	Dedicated connectivity, risk, support	Contracted
Enterprise	Private deployment, custom integration, SLA	Contracted

Source: live /pricing page. Do not publish invented list prices.

6. Go-to-market

- Inbound: www.evermount.co → Request Access → POST /demo-booking.
- Outbound: LinkedIn and direct sales to 2–3 ICPs, not every footer persona.
- Developers: gated docs and keys after approval; SDKs labeled coming soon.
- Research: publish notes only when they exist; empty /research is acceptable.

7. What stays internal

A public review of the live site found oversharing of sequencing and architecture, not of source code. Competitors can copy a roadmap more easily than a ticker widget. Keep the following off the website and out of public API docs:

- NOW / NEXT / THEN / VISION (quant → systematic trading → market-making → global connectivity).
- Repeated six-layer stack as a blueprint (one conceptual diagram is enough).
- Full planned API catalog and language/Kubernetes roadmap presented as facts.
- Named internal AI agent topology and proprietary strategy language in bios.
- GEX / COMEX gold options engine, vendors, and decision API.

8. Organization

Public leadership names: Daniel Mawioo (CEO, co-founder), Evans Kipngetich (CDO, co-founder), Tony K. (Head of Quantitative Research), Bonface Kuria (Head of Security & Infrastructure), John Esther (Senior AI Engineer). Bios on the site include hedge-fund pedigree, PhD, and proprietary-strategy claims. Those must be fact-checked before they are used in investor or enterprise diligence. Do not use “world-class” as a substitute for proof.

9. Technology thesis (internal)

Commercial frontend: Next.js 15, Node 24, Vercel, www.evermount.co. Account APIs: existing backend at api.evermount.co (JWT, wallets, KYC, admin). Internal research: gex-engine (Python/FastAPI, paper mode, XAUUSD / COMEX mapping) — not a public Evermount API. Do not merge GEX into the public OpenAPI.

10. Risks

Risk	Why it matters	Mitigation
Two products, one brand	Buyers and regulators see both a tech vendor and a capital account	Separate copy, emails, and eventually separate apps or roles
Capability inflation	Site lists APIs, venues, and agents that are not live	Ship only gated access; mark coming soon; no fake metrics
Regulatory	Wallet/deposit UI can look like a fund solicitation	Counsel on legal pages; no public deposit CTA
Competitive disclosure	Roadmap and stack teach rivals the sequence	Public site = category + proof; playbook stays internal
Bio / claim risk	Unverified pedigree fails diligence	Short, accurate bios only

11. 90-day operating plan

- Days 1–30: Sync backend copy, CORS, demo-booking, waitlist. Tighten homepage (cut roadmap). Fact-check bios. Align /login metadata.
- Days 31–60: Define whether Track B stays. If yes, noindex and rebrand the portal as an account app. If no, freeze new capital features.
- Days 61–90: One real gated capability (e.g. access request → documented historical or research API) with honest status. Do not launch a fake SDK.

12. What this plan does not claim

No revenue, ARR, AUM, customer logos, latency, uptime, licensed market-data rights, or regulatory authorizations are stated. Pricing is a commercial process, not a published schedule. This document is for internal and counsel use. It must not be uploaded as a public download on www.evermount.co.
